The International Exchange and Testing of
CASSAVA GERM PLASM in AFRICA

Proceedings of an interdisciplinary workshop held at IITA, Ibadan, Nigeria 17-21 November 1975

Editors: Eugene Terry and Reginald MacIntyre

Cosponsored by the International Development Research Centre and the International Institute of Tropical Agriculture
The International Exchange and Testing of Cassava Germ Plasm in Africa

Proceedings of an Interdisciplinary Workshop held at IITA, Ibadan, Nigeria, 17–21 November 1975

Editors: Eugene R. Terry and Reginald MacIntyre
Contents

Foreword 5
Participants 9
Welcoming Address, S. K. Hahn 11

Theme Papers
Possibilities for economic research into cassava production systems in Africa, J. C. Flinn 15
Improvement of cassava at the International Institute of Tropical Agriculture, S. K. Hahn 21
Cassava bacterial blight in Africa, E. R. Terry 23
Advances in research on the economic significance of the green cassava mite (Mononychellus tanajoi) in Uganda, Z. M. Nyiira 27

Country Presentations 31
Summary of General Discussion 35
Appendix 1 Agronomic aspects of the International exchange and testing of cassava germ plasm
Part A Cooperative testing and selection 39
Part B Germination and pollination 41
Part C A rapid multiplication technique, A. K. Howland 42
Part D Guidelines for the establishment of a cassava improvement project: the Zaire model, H. C. Ezumah, S. Kabonyi, K. Beya 45

Appendix 2 Phytosanitary aspects of the international exchange and testing of cassava germ plasm
Part A Suggested guidelines relating to the international movement of cassava planting materials 51
Part B Description and evaluation of cassava mosaic disease in Africa, E. R. Terry 53
Part C Major pests of cassava in Africa and preliminary guidelines for screening of resistance, K. Leuschner 55

Appendix 3 A note on the IITA training program 57
Part B
Description and evaluation of cassava mosaic disease in Africa

E. R. Terry
International Institute of Tropical Agriculture
Ibadan, Nigeria

At present, there is limited information on cassava diseases and even more limited data from reliable studies on yield losses due to these diseases. This lack of information has led to the assumption that cassava diseases are of minor importance.

There are several cassava diseases caused by bacteria, fungi, virus, and other unknown agents. In Africa, although cassava mosaic disease is one of the most widespread, cassava bacterial blight which has been recognized to date in Zaire, Nigeria, and Cameroon, is considered to be more serious in terms of its severity, ease of spread, and the loss of yield and planting material that it causes.

The following is a brief description, with photographs, and suggested procedures for evaluating the severity of cassava mosaic disease. These descriptions should be considered only as tentative aids to field recognition of the disease, and the scoring procedures merely as suggested guidelines to evaluating the severity of the disease and the reaction of cassava plants to it.

**Symptoms** The disease is characterized primarily by chlorosis of discrete areas of the leaf lamina and these areas fail to expand fully so that stresses set up by unequal enlargement of adjacent areas cause distortion of the leaflets. The typical picture is a leaf reduced in size, misshapen and twisted with bright yellow areas separated by normally green areas. All leaflets may show a nearly uniform mosaic pattern or the mosaic pattern may be localized in a few areas only.

**Classification of disease severity** The scoring system for evaluation of test plant reaction to CMD is based on the following five classes of severity:

- **Class 1** — Apparent field resistance, no symptoms seen.
Class 2 — A mild chlorotic pattern over entire leaflets, or mild distortion only at the base of leaflets, with the remainder of the leaflets appearing green and healthy.

Class 3 — Strong mosaic patterns all over leaf, narrowing and distortion of lower one-third of leaflets.

Class 4 — Severe mosaic pattern, severe distortion of two-thirds of leaflets, and general reduction of leaf size.

Class 5 — Severe mosaic, severe distortion of four-fifths or more of leaflets, twisted and misshapen leaves, and severe reduction of leaf size.
