Oil crops: proceedings of the three meetings held at Pantnagar and Hyderabad, India, 4 – 17 January 1989
The International Development Research Centre is a public corporation created by the Parliament of Canada in 1970 to support research designed to adapt science and technology to the needs of developing countries. The Centre's activity is concentrated in six sectors: agriculture, food and nutrition sciences; health sciences; information sciences; social sciences; earth and engineering sciences; and communications. IDRC is financed solely by the Parliament of Canada; its policies, however, are set by an international Board of Governors. The Centre's headquarters are in Ottawa, Canada. Regional offices are located in Africa, Asia, Latin America, and the Middle East.

This series includes meeting documents, internal reports, and preliminary technical documents that may later form the basis of a formal publication. A Manuscript Report is given a small distribution to a highly specialized audience.
OIL CROPS:
PROCEEDINGS OF THE THREE MEETINGS HELD AT
PANTNAGAR AND HYDERABAD, INDIA, 4-17 JANUARY 1989

1. The Brassica Subnetwork-II
2. The Other Oil Crops Subnetwork-I
3. The Oil Crops Network Steering Committee-I

Edited by
Abbas Omran
Technical Adviser, Oil Crops Network

Organized by
Indian Council of Agricultural Research, New Delhi, India
G.G. Pant University of Agriculture and Technology,
Pantnagar, India
Directorate of Oilseeds Research, Hyderabad, India
International Development Research Centre, Ethiopia/Canada

CONTENTS

Foreword ................................................. v
List of Participants ..................................... vi
Introduction ............................................. xi

Part 1. Brassica Subnetwork-II

Opening Remarks. MAHATIM SINGH ..................... 2
Recent Development in Oilseed Brassicas. R.K. DOWNEY ............. 4
The Interinstitutional Collaborative Research Program on White Rust
(Albugo candida) Between India (ICAR) and Canada (IDRC) for
Rapeseed-Mustard Improvement. P.R. VERMA ................... 9
Stability Parameters for Seed Characters In Different Species of
Oleiferous Brassica. H.SINGH, D.SINGH, and V.S. LATHER ........... 14
Oilseed Brassica Research in India. P.R. KUMAR .................. 17
Transfer of Technology and On-farm Trials of Rapeseed and Mustard.
BASUDEO SINGH ........................................ 24
Status of Breeding Research on brassica Oil Crops at Pantnagar, India.
G.N. SACHAN ........................................... 30
Agronomic Investigations on Rapeseed and Mustard at Pantnagar. ARVIND
KUMAR and R.P. SINGH .................................. 35
Disease Problems in Brassicas and Research Activities at Pantnagar.
S.J. KOLTE, R.P. AWASTHI and VISHWANATH .................. 43
Effect of Some Epidemiological Factors on Occurrence and Severity of
Alternaria Blight of Rapeseed and Mustard. R.P. AWASTHI and
S.J. KOLTE ............................................. 49
Problems of Insect Pests in Brassicas and Research Work at Pantnagar.
G.C. SACHAN ........................................... 56
Economic Performance, Potential and Constraints in Toria Production.
L.R. SINGH ............................................. 66
Rapeseed in Egypt. BADR A. EL-AHMAR ..................... 70
The Role of High-Yielding Varieties and Production Techniques
on Oilseed Brassica Performance in the Central, South-Eastern
and North-Western Zones of Ethiopia. HIRUY BELAYNEH, GETINET
ALEMAW and NIGUSSIE ALEMAYEHU ..................... 72
The Achievements and Future of Brassica in Kenya. M.J. MAHASI ....... 79
Rapeseed Adaptation Trials in Cyprus. A. HADJICHRISTODOLOU .................. 83
The Rapeseed (Brassica napus L.) Quality Breeding Progress in Shanghai
Academy of Agricultural Sciences (SAAS) for Recent Years.
SUN CHAOCAI .......................................... 92
Statement on the Execution of the Sino-Canadian Rapeseed Breeding
Project in 1988. WANG ZAO MU ............................ 94
A Preliminary Study on the Combining Ability and Heritability of Main
Agronomic Characters in B. juncea. WANG ZAO MU and
WANG YAN FEI ........................................ 98
LIU CHENG QUING and HONG HAI PING .................. 103

Safflower (Carthamus tinctorius) is an ancient oil crop in Egypt. It was planted and used as a raw material for many industries in Pharaonic era. The extracted oil was used as an edible and as painting oil. The petals were used as a source of pigment for clothes.

Safflower plant was also used as a border for winter crops like wheat, barley and fababean. The majority of the area was planted in upper Egypt, as a border of each farmer after flooding season.

This area was cultivated mainly for petals and used for salted food conservation and the seed was used for bird feeding.

After high dam, continuous irrigation system was established and the area occupied by cotton in upper Egypt increased, and the area occupied by safflower decreased from 4000 faddan to less than 10 faddans (1 faddan = 4,200 m²).

Due to the severe shortage in national edible oil production and the increase of annual consumption, and the limitation of edible oil sources for national extraction which depend mainly on cottonseed and soybean, it is essential to have other sources of edible oil. Those new sources are sunflower (summer) and rapeseed (winter) for new or old lands under irrigation. Safflower was devoted to the area which is rainfed. The annual precipitation ranges from 100 to 150 mm and in some years it reaches 200 mm. This area is located along the north coast and estimated to be more than 40,000 faddans.

**Breeding Objectives**

The breeding objectives of safflower under rainfed conditions are discussed below:

1. **Drought resistance**

To select drought resistant varieties with a good spreading root system, high capability for water uptake and short duration or high growth rate. This is the main objective in safflower breeding program. For that, the available germplasm (80 landraces and introductions) were sown this season under rainfed condition in north coast area, for screening this material according to their performance.

2. **Spineless varieties**

Most of the agronomic practices are done by hand, so spineless varieties are preferred. However, their yield is low.

3. **Early maturing variety**

The amount of rainfall is higher January and February, and hence, an early maturing variety with a reasonable seed and oil yield is satisfactory.

4. **Resistance to broomrape**

Broom rape is a problem which spreads all over the country. Orobanche carinata, which attacks safflower, is more dangerous. Fortunately, there is a wide variability of susceptibility within the available germplasm. A breeding program for broomrape control will be started next season.

5. **Resistance to salinity**

The new land in north coast is characterized in many places by
high salinity. So, a variety which can tolerate or resist salinity is important for cultivation in this area.

The future expansion of safflower will be under rainfed areas. Since this area is cultivated to barley, an intercropping program should be conducted to give an answer for:

- suitable intercrop ratios,
- suitable plant density for both crops, and
- suitable varieties with minimum competition and reasonable yield per unit area.

We believe that expansion of safflower production in this area will offer a new source for edible oil and assist in increasing the national production.
