Millet Usage & Attitude Study

Research findings on a Usage & Attitude study across Urban as well as Rural areas of India.

2017.
A market research study on consumption of minor millets and millets in India among Consumers and Retailers were commissioned by McGill University. This part of the research is a section of a bigger study for understanding Millet consumption, habits, practices followed in India.

The research findings will be primarily used to inform a developmental research project on usage of millets for economic & health benefits. The key findings of the research would also be fed into the business plans & marketing strategies of SME of Food Processing.

The research is planned to indicate insights such as sources of consumer information on healthy foods & ingredients, factors involved in decision making on choices, preferences and expectations.

For this kind of expanded information area both Secondary as well as Primary research was contemplated as only available secondary data is not sufficient or available.

Indianet, a full service marketing research agency, operating since 2003 was commissioned to conduct the research and submit the findings.

This report contains the findings of the research conducted across various cities / towns in India.

**Key objectives of the research was to find out the**

- Awareness levels of the different varieties of Millet
- Consumption pattern of the different varieties of Millet - Frequency, volume, price, purchasing habits & practices
- Attitude and preferences of consumers towards different varieties of Millet
3. Information areas

Category Awareness and opinion about Millet

1. Top of mind, spontaneous and aided awareness of the different cereals, and the different varieties of Millet
2. Source of awareness of the cereal
3. Spontaneous opinion on millets and its varieties that they are aware of
4. Perceived health benefits of eating millet
5. Barriers to eating Millet
6. Comparison of millet in terms of good and bad qualities as compared to their staple cereal

Consumption pattern of Millet

1. Main cereal consumed
2. Factors influencing consumption of millet – season, price, habit, taste, health benefits, food preparation process, others
3. Frequency of consuming Millet and its different variety
4. Who all in the household eats Millet
5. Regular and Special preparations made with Millet
6. Reasons for eating Millet being the main consumed cereal or not
7. If started consuming Millet recently and reasons for it
8. Intention to consuming Millet in the future
9. Wanting to change to another cereal as the most frequently consumed

Purchase Process

1. Frequency of purchase
2. Volume purchased at a time,
3. SKU purchased and price paid (to capture price awareness),
4. Factors considered while purchasing cereal/Millet - quality, price, etc

Decision making process

5. Key decision maker for purchasing cereals for the household
6. Influencers – Retailers/ advertising / WOM
4. Research approach

To achieve the objectives of the study, we conducted both Secondary Research as well as Quantitative Research.

A. Secondary Research

Includes information from published sources like

- Market /Industry journals
- Commodity reports on Government or private sites
- Newspaper/Magazine articles

All the data gathered from the secondary research is analysed to present findings.

The key objective of the secondary research would be to get some understanding of the market sizes for the different varieties of Millets and the trends in cultivation as well as consumption for the same.

B. Quantitative Research

The quantitative research would be done mainly through personal interviews with the identified target segments.

For this study, we included 3 main segments of respondents

- Regular consumers of Millet
- Consumers of other staple cereal but consuming millet occasionally
- Traders for Millet, mainly retailers and some wholesalers as well

The spread of the study included those states where Millet consumption and production is high as well as certain states where other grains dominate but Millet is consumed occasionally.

Both metros as well as smaller cities were included in the study to understand differences in behaviour amongst urban and semi urban areas.

Personal face to face interviews was conducted with the aid of a structured questionnaire of pre-decided questions to different target audiences.

A detailed questionnaire was prepared covering the “List of Information collected” as mentioned under the section. Our interviewer’s was then trained on the subject and thereafter they conducted the interviews with the target audience.
Care was taken not to reveal the identity of the client before, during and after conducting of the interview.

5. Research methodology

**Quantitative interviews**

In this methodology, face to face interviews were conducted with the target segment with the aid of a structured questionnaire. The questionnaire was developed by the research executive in charge of the project, keeping in mind the information collection needs. The questionnaire was discussed with and approved by the client before it was used for the study.

Different questionnaires were developed for different target segments so that the questioning pattern is appropriate.

The interviews were conducted either through cold calls or through prior appointments. They were in most cases done at the shops or residence of the target segment.

In each city, based on the total sample size and the quotas we drew up the list of areas which needed to be covered for the study. Care was taken to ensure coverage of all the zones in the city.

As there are several types of Millets and they are known with different names across the country, we took help of photographs and showed the same to clients for correct identifications.

6. Target audience profile

To achieve the objectives of the study we interviewed Mothers of children aged between 8-12 years falling under the below criteria:

- **Regular consumers of Millet** – Who regularly consumed any type of millet in the household

- **Consumers of other grains but aware of any millet** – Who regularly consumed other grains besides millets but were aware of OR using millets occasionally to prepare dishes
For the Retail interviews mainly retailers and some traders as well were interviewed—these were the stores which regularly stock as well as sell some variety of Millet and are in the business of selling grains and staples for at least 5 yrs.

7. Sample spread & size

Fieldwork for this study was conducted in the last quarter of 2017.

Summary of Findings
1. Consumer speak

**Category Awareness and opinion about Millet**

Majority (87%) of the respondents interviewed recalled some variety of Millet or the other when asked which ones they were aware of. Top of Mind recall was the highest for Pearl Millet (Bajra) 32% followed at a distance by Sorghum (Jowar) 20% and Finger Millet (Ragi) 15%. Out of all the varieties, these three were recalled prominently both at the unaided as well as aided awareness stages. Post aiding it was Sorghum which stood at number 1 position (among Millets) 94% followed by Pearl Millet (bajra) 88% and Finger Millet (Ragi) 60%. Interestingly in smaller towns, the awareness for Little Millet as well as Foxtail Millet was quiet high.

Word of Mouth was the only main source of awareness for Millets - either it was the Family members or Friend's / Neighbors who passed on information on the same. Other sources of awareness were negligible.

Millets were considered to be "good for health", "easy to digest", "good for weight reduction" as well as "good for people who have deficiencies in them" but very little was known about them. Not only in terms of variety but the "availability", "knowledge of what to do with the Millet too was missing".

"Good for health", "Easy to digest", "gives required nutrition", "makes bones / body strong", "reduces body weight", "keeps you warm in winter" and "good for diabetics" were some of the key health benefits mentioned.

First of all the major barrier to eat is it's "availability", followed by "very little knowledge on how to cook" or "what to cook". Last but not the least "children / family members do not like the taste" which makes it an occasional grain which can be used for cooking.

**Consumption pattern of Millet**

Rice and wheat were mainly consumed by almost all the households.

Across all the cities where interviews were conducted, the key factors for considering eating of Millets emerged as "Easy/light to digest" and "Healthy to eat".

Only Pearl and Finger Millet were considered for consumption "once a week". For the other varieties of Millets it was “less often than once a month”.

Husband/Main Earner was the main consumer followed by the wife/housewife close behind. Children came in at a second position way behind.

In most cases, Millet cooked was not regular. Among the regular users the dishes prepared were "Roti/Chapati (an Indian flatbread)", Bhakri (a regional version of Indian flatbread)", "Khichdi"(an Indian wet rice like / or with rice preparation of mix millets with other grains), "Dosa"."Kali/Ragi
Ball". In addition, occasionally mostly sweet preparations were made like "Sevai / Kheer" (an Indian sweet dish wet), "Halwa" (an Indian sweet dish semi dry).

Reason for eating Millets was “easy to cook”, “good for health” and “can make roti / chapathi / bhakri’s (an Indian flatbread) and "easy to cook". Nothing specific was mentioned which made Millet better than Rice or Wheat.

For betterment of health some respondents started consuming Millet recently.

Those who are already users of Millets, very few wanted to try a new/additional variety of Millet (only 19% wanted to try) however among the rare/non consumers of Millets the interest level was far higher (50%). Key reasons being "good for health", body becomes strong", "reduces body weight " and "gives nutrients".

Purchase Process

Frequency of purchase was mostly around once a month. As most of the millets are available unbranded and loose, purchasing was done once a week by a large number in smaller quantities. In the Tier 1 cities the most common weight purchased was 1kg. However in the smaller towns Tier 2 there was a notable portion of respondents who bought 5 kgs. at a time.

The presence of branded millets were very few. Hence the number of SKU’s available too were very few.

2. Retail speak

Pearl Millet was the most stocked Millet variety followed by Sorghum and Finger Millet. Other types of millets were stocked by only a few retailers.

Overall proportion of Millet sales out of 100% grain sales was between 1-10% compared to Rice 40% and Wheat another 40%.

Over half the retailers sold Millet since long averaging 5 years or more.

Millet sales according to the retail remained the same compared to last year - nearly half (45%) said so. 40% of the retailers also said that the sales have increased over the past. The increase of sales was mainly recorded in the Tier 1 cities.

According to retailers, overall, the consumers of Millet are from various localities around town/city. There is no particular locality where the consumption is higher. The consumption appears to be done most in Middle Class / Upper Middle Class households mostly (68%). The consumption is also present among the poorer class of households. Basically spread across SEC A, B and C households. The Main earner’s occupation of Millet consuming households appeared to be mixed from Skilled workers at the
lowest level to the Professionals at the highest. Among businessmen households, consumption appeared to be a little less. Most Millet consuming households appeared to be from educated households. Main purpose for consuming Millet was for Occasional preparations and for Healthier living.

3. **In nett**

Production of Millets in the country is not too encouraging. Over the decade, overall production is heading slightly downwards. Though the popularly used millets are trying to hold on to their position, the smaller millets are losing out slowly but steadily.

Due to the unknown uses, benefits and cooking methods, Millets were not too popular and still is. However in the urban cities (Tier 1) it is gaining popularity due to its health related benefits. In fact across cities / towns at present Millets mostly are available loose. But scouring the Supermarkets and Hypermarkets it has been discovered more and more branded products are coming in both organic as well otherwise.

Retail shops stock Millets however the proportion of sales being low it is not a pull product grain compared to Rice and Wheat.

According to retailers, Overall, the consumers of Millet are from various localities around town/city. There is no particular locality where the consumption is higher. The consumption appears to be done most in Middle Class / Upper Middle Class households mostly (68%). The consumption is also present among the poorer class of households. Basically spread across SEC A, B and C households. The Main earner’s occupation of Millet consuming households appeared to be mixed from Skilled workers at the lowest level to the Professionals at the highest. Among businessmen households, consumption appeared to be a little less. Most Millet consuming households appeared to be from educated households. Main purpose for consuming Millet was for Occasional preparations and for Healthier living.
Detailed Findings
Secondary Research
From the Nutrition angle Millet scores positively with Wheat as well as Rice, the main staples being consumed in the country. The profile of various grains (in 110gms) is given in the table below to indicate the positives Millets have vis-à-vis Wheat and Rice.

Source: National Institute of Nutrition, Hyderabad

However from the production figures the basic staples rice and wheat are way ahead of Millets. Rice was the highest produced crop in the country followed closely by Wheat.

Millets was the third highest staples (all the different varieties of Millets taken together) at 7% of the total crop production.

The pattern was more or less similar across the previous 10 years.

Source: Ministry of Agriculture & Farmers Welfare, Government of India. www.data.gov.in
6.66% was the total proportion of Millets produced during the year 2016-17.

Pearl Millet and Sorghum were the most popular ones produced followed at a great distance by Finger millet. The production of other millets compared to the total production of millets was negligible.

The years 2012-13 up to 2014-15 (3 years) the production of Sorghum was the lowest. Since the last 2 years and the same is now picking up and is on the upswing.

The production of Pearl Millet did also see some dips however over the past 5 years it is faring better than Sorghum and increasing it’s production gradually. Finger millet (on a smaller scale) appears to progress like Pearl Millet.

For other small millets, the production appears to be growing smaller by the year.

Primary Research - Consumers Section
1.1 Q.B.  **Education of the Main Earner**

*Majority of the respondents were from households whose main earner was educated SSC / HSC upwards (92%). Only 8% claimed having done some schooling.*

![Pie charts showing education levels](chart1.png)

**Tier 1 cities**

- 30% Illiterate
- 5% School upto Class 4
- 53% SSC / HSC
- 3% Some College but not Graduate
- 8% Graduate Post Graduate General

**Tier 2 towns**

- 32% Illiterate
- 4% School upto Class 4
- 38% SSC / HSC
- 15% Some College but not Graduate
- 0% Graduate Post Graduate General

1.2 Q.C.  **Occupation of the Main Earner**

*38% of the sample was from Business community background, 40% came from the Service stream (white collar professions / service) and the balance constituted of Petty Trade, Skilled workers and others.*

![Occupation chart](chart2.png)
1.3 Q.D. Age profile of the sample
Most of the respondents were from the age group of 35 to 44 years (48%), followed by 30-34 years and 24-29 years respectively. Main condition for interviewing was the respondents should have been a mother of a 8-12 year old child.

![Age profile of the sample](image)

2.1 Q.1a. Grains used/cooked regularly at least once a week
Besides Rice and Wheat which is the most common grain used across all the households, Millet was the third most popular grain used. Though third most popular, the proportion of households using millets were quite low.

Most popular millet among the different varieties were Finger Millet, Sorghum and Pearl Millet. Pearl Millet appeared to be popular in the North and Eastern parts of India. Sorghum appeared to be popular West, South of India as well as Eastern India (Tier 1 towns). Finger Millet appeared to be most popular in Western and Southern India.

2.2 Q.1b. Grains used/cooked most in the household
Only 9% of the households claimed that millet was cooked most in their households.

2.3 Q.1c. Main reasons for using/cooking with a particular grain
Rice was favored most for familiarity, tastiness, easy to digest and not being so expensive. Wheat on the other hand had stronger health connotations attached to it – Healthy, good for the heart and good for weight loss.

Millet was considered to be “healthy” and “good for weight loss” which was why the same was being consumed.

3.1 Q.1d & e. Awareness of Millet – Top of mind, Unaided & Aided recall
Top of mind awareness of Millet was quiet positive. 87% of the respondents interviewed recalled some form of millet. Most popular was Pearl Millet( Bajra )32% followed by Finger Millet 25%, Sorghum ( Jowar ) 20%. 14% of the respondent only recalled the generic name of Millet.

Between the 2 Tiers of towns covered for the study, awareness of Pearl Millet( Bajra ) & Sorghum ( Jowar ) was far higher at the Top of Mind awareness level.
At the Unaided level, Pearl Millet (Bajra) and Sorghum (Jowar) was more popular across Tier 1 markets whereas it was Finger Millet which was better known, than Pearl Millet and Sorghum in the Tier 2 markets.

Post aiding, the awareness levels of Sorghum (Jowar) rose to 85% followed by Pearl Millet (Bajra) at 69% with Finger Millet (Nachni, Ragi) at third position 52%.

Awareness of other types of Millet were found to be very low.

- Little Millet 47%
- Foxtail Millet 39%
- Kodo Millet 17%
- Barnyard Millet 19%

Overall, nearly everyone interviewed for the study knew about 1 type of millet or the other.

3.3 Q.2a,b. First as well as other sources of awareness about Millet

Key source of awareness of various types of Millet were restricted to family members and friend’s / neighbors. Word of mouth amongst known people was the key source. Over 3/4ths of the sample who were aware of a particular type of millet claimed to know about it from Family member or a friend/neighbors.

Second most important source of awareness was TV followed by Doctor’s (specifically in the case of Finger millet).

3.4 Q.3. Benefits of eating Millet

Different types of millet had different key benefits as perceived by the consumers. If it was “good for health” and “easy to digest” for Pearl Millet, it was “keeps health good” and “gives the required nutrition” for Sorghum.

Finger and Foxtail Millet was perceived to be “good for diabetics”.

Little and Kodo Millet were “meant for weight loss” and “keeping one healthy”.

Barnyard millet was perceived to be “good for the heart”, “makes bones strong” and “has vitamins / minerals”.

3.5 Q.4 a,b. Importance of factors considered for eating Millet

Mean scores were calculated out of a maximum possible score of 5.00 (indicating BEST score).

Importance of factor for consuming Millet were as follows:

- Healthy to eat 4.86 out of a maximum 5.00
- Light to digest 4.39 out of a maximum 5.00
- Family members like it 4.35 out of a maximum 5.00
- Tasty 4.33 out of a maximum 5.00

“Ease of preparation”, “reasonable price” and “habituated to eat it since childhood” were the other important factors for consuming Millet.

3.6 Q.4 c. Reasons for cooking Millet regularly at home

Various reasons emerged for different types of Millet.

Main reasons for consuming Pearl Millet was due to it being “Good for health” and “has a good taste”.

For Sorghum it was “easy to cook”, “good for health” and “can make bhakri’s ( a regional Indian flatbread ).

And for Finger millet, it was “can make bhakri’s ( a regional Indian flatbread )”, “can give it to small kids”, “Can make Papad ( an Indian wafer snack )” and “for good health”.

The other types of Millets were consumed by a negligible few regularly.

3.9 Q.5 a. Frequency of consuming Millet at home

“Pearl millet” and “Finger millet” were consumed more “once a week”.

Whereas the usage of Sorghum was spread between “once a week” to “once a fortnight” to “once a month” or even “less often”.

Sorghum millet was more like a type which can be consumed anytime.

<tr>
<td>Easy to digest</td>
<td>3%</td>
</tr>
<tr>
<td>Reduces cholesterol</td>
<td>3%</td>
</tr>
</tbody>
</table>

3.15 Q.5 g. Reasons for wanting to consume Millet at home

“Health” was the single most important factor for which Millet was considered for consumption at home.

<table>
<thead>
<tr>
<th>Reason</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good for health</td>
<td>19%</td>
</tr>
<tr>
<td>Body becomes strong</td>
<td>6%</td>
</tr>
<tr>

<td>5%</td>
</tr>
<tr>
<td>Reduces body weight</td>
<td>5%</td>
</tr>
<tr>
<td>Gives required nutrients</td>
<td>4%</td>
</tr>
</tbody>
</table>

3.16 Q.6 a. Frequency of consumption of Millet at home

Though a lot of respondents wanted to try millet at home, it was mainly once a week or less often than that.

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Total</th>
<th>Tier 1</th>
<th>Tier 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base :</td>
<td>304</td>
<td>185</td>
<td>119</td>
</tr>
<tr>
<td>%</td>

3.17 Q.6b-e. Purchase habits of Millet – Quantity bought at a time, SKU / Pack quantity bought at a time, Amount paid and Type of shop bought from

Higher quantities of Millet was purchased in Tier 2 towns compared to Tier 1 cities.

Most common SKU size which was bought was 1kg or 2 kg pack. As there are only few branded products in the market, in most cases, loose millet was purchased either in 1kg or 2 kg units.

In the Tier 2 town category, around a fifth (17%) bought 5kg units at a time.

In Tier 1 cities, 12% of the consumers only bought 500gms at a time.

Serials, News, Movies and Comedy shows were the top favorites amongst the Tier 1 cities. In the smaller cities, it was only Serials and News.

Though in Tier 1 city Serials were way ahead in the top most preferred program, in Tier 2 towns the scenario was different. Here both Serials as well as News was nearly at par.
Except for Rice, Wheat and Pearl Millet other grains were stocked by very few Traders / Retailers. Though Pearl Millet appears to be on par with Rice and Wheat, the reality isn’t so since the category of Wheat has expanded in a big way in the form of ground wheat (Branded) across all the markets.

Wheat, by far is the highest selling amongst all grains.

Among the Millets, Pearl Millet (Bajra) appeared to be the most popular followed by Sorghum (Jowar) and Finger Millet.
City wise, the popularity of Millet differed slightly. In Tier 1 cities, Sorghum and Finger Millet appeared to be more popular in Mumbai and Bengaluru. Foxtail Millet appeared to be quiet popular in Bengaluru.

In Tier 2 towns, Pearl Millet was the most popular one across all the four zones. Sorghum and Finger Millet were the 2 types of Millet which was used across the three zones of North, West and South.

In the East, it was only Pearl Millet.
Except for Rice and Wheat, every other grain sold very little in comparison. 34% of the shops claimed selling Wheat which constituted 31-40% of the total sale of grains. In case of Rice it was 27% who said the sales constituted 31-40%. In the case of Millet the overall proportion of sales was between 1-10% of the total.

A little over a half (58%) of the shops claimed selling Millet over 5 years. Selling Millet was found to be much older in the Tier 1 cities than Tier 2 cities (60% and 52% respectively). Millet selling was found to be more recent in the cities of Kolkata and Ranchi compared to others.
Pearl Millet was the most popular among all types of Millet followed by Finger Millet and Sorghum. These three were the main Millet which was sold across the country. The next popular Millet in line were Foxtail Millet and Little Millet. The least popular ones were Kodo Millet and Barnyard Millet.

Except for Foxtail Millet, every other type of Millet sold more in Tier 1 cities than Tier 2 towns.
A little over a third of the shops agreed that the sales of Millet have increased over the past. 17% said the sales had gone down and 45% said that the sales remained the same – no change.

Main increase noticeable was in Tier 1 cities. Compared to Tier 2 the jump was significantly high. It was the Tier 2 towns where the sales got affected.

Overall, the consumers of Millet are from various localities around town/city. There is no particular locality where the consumption is higher. The consumption appears to be done most in Middle Class / Upper Middle Class households mostly (68%). The consumption is also there among the poorer class of households. Basically spread across SEC A, B and C households. The Main earner’s occupation of Millet consuming households appeared to be mixed from Skilled workers at the lowest level to the Professionals at the highest. Among businessmen households, consumption appeared to be a little
Most Millet consuming households appeared to be from educated households. Main purpose for consuming Millet was for Occasional preparations and for Healthier living.
