IDRC Grant/ Subvention du CRDI: 108347-001-Measuring the supply, use, and impact of open data
As citizens demand accountability, governments keep data locked away

The Web Foundation believes that open data must be:

- for everyone — a right for all
- the data people need
- data people can easily use

In this edition of the Barometer, 1,725 datasets from 15 different sectors across 115 countries were assessed. We found that most governments are not meeting the basic Open Data Charter principles. In most cases, the right policies are not in place, nor is the breadth and quality of the datasets released sufficient.

Almost all countries in the MENA region are backsliding on open data, with rankings and scores in seven out of 10 countries down since the previous Barometer.

There is not one truly open dataset in the region, out of the 180 datasets we analysed in our study.

Due to a lack of civil society engagement with open data, there is little pressure for governments to make data public, particularly in relation to social issues.

General regional highlights and findings

Climbing one place, Israel is the only country in the MENA region to improve its ranking in the top 50 of the global ranking. In general, countries in the region have made no progress on open data implementation and barely turned the region when most countries began their initiatives a few years ago appears to have faded.

No government in the region publishes data, open or closed, in some areas usually considered essential to improve social policy or government accountability. While some do recognise the potential of open data to drive economic development, the general absence of political leadership in this area has led to a lack of open data awareness, capacity and legal frameworks.

Almost all countries in the MENA region are backsliding on open data, with rankings and scores in seven out of 10 countries down since the previous Barometer.

What is Open Data and why is it important?

Open data is data which is freely available and shareable online, without charge or any other restrictions. Without good data, it is impossible to hold governments to account for the decisions that they make, the policies they pass, and the money they budget and spend.

Some countries, including Israel and Saudi Arabia, have recently started working to improve their open data strategies.

Countries have shown no, or very little, progress on their respective open government data agendas. No government has adopted the Open Data Charter, making the region one of only two in our analysis (alongside the Caribbean) with no Charter adoptees.

Implementation of open data programmes

Some datasets in the region are frequently available — such as national census, government budget and international trade data — although not as truly open data.

Only 66% of data in our analysis was available online. Most data in the MENA region is locked with legal or technical restrictions. Land ownership, government spending and company registers are the least accessible datasets in the region.

Impact that open data is having

While social impact has been non-existent in the past, the region showed the first signs of impact in this edition. For example, an Israeli startup is using available air quality data to combat pollution.

With the exception of some limited examples in Israel, the region is failing to harness the impact of open data. It is even missing out on the kind of economic impacts that are commonplace in the rest of the world.

This fourth edition of the Barometer was supported by grants from the Omidyar Network and the Open Data for Development (OD4D) programme, a partnership funded by Canada’s International Development Research Centre (IDRC), the World Bank, United Kingdom’s Department for International Development (DFID), and Global Affairs Canada (GAC). The OD4D programme supported the report with the aid of a grant from the International Development Research Centre (IDRC), Ottawa, Canada.

Egypt advanced slightly at the regional level, with efforts to improve its open data readiness and advancement at the implementation and impact levels. There was increased interest in open data from civil society (through urban planning and transport initiatives) and from academia (e.g. the access to knowledge initiative). The country hosted several data-driven innovation events and activities in the past two years, illustrating this increased engagement. However, with no sustainable process and with inadequate political commitment, this open data progress may fizzle. Datasets are frequently outdated and face licensing, quality and discoverability issues, often making them useless.

As a regional economic hub with heavy investment in ICT infrastructure and state of the art technology, the UAE is well-placed to progress its open data efforts. While it understands the potential of open data for economic development and social well-being, it seems less interested in open data as a tool for citizen empowerment and government accountability. Some of the Emirates have become fairly advanced in their provision and use of data, such as Dubai with the Smart Dubai initiative and the Dubai Data Law, even if these are not strictly open data initiatives. Others have made more modest efforts.
