

The results show the different kinds of water contaminations and they pointed the necessity to take care and preserve the water as an important resource for the life.

AQUATOX project gave us the experimental kit to develop the experiments and it could be used in the environmental formation of other students. Because of project we studied different topics and we could exchange experiences with other groups of children and our school will have a computer machine.

We learned to use simple and economic resources to control our water contamination, the project involved us in many important fields: the environmental contamination, the difference between microbiological and toxicological contamination, to help in the preservation of our environment and it allowed to participate and exchange experiences with many scientists and technicians in concourses, meetings and visits to interesting places.

This project allowed us to learn how can we control our water contamination, to conserve the environment and how can we improve our life quality.
